Приближенное решение задачи оптимального управления

Михайлин Д.А. 410 группа

12 мая 2019 г.

1. Постановка задачи

Требуется найти приближенное задачи

$$\int_0^{\frac{\pi}{2}} u^2 dt \to inf$$

$$x(0) = 0; x(\frac{\pi}{2}) = 0; x'\left(\frac{\pi}{2}\right) = -\frac{\pi}{2}; \ x'' + xe^{-\alpha x} = 0; \ \alpha \in [0; 25]$$

2. 2. Необходимые условия

Сделаем замены:

$$x_1 = x; \ x_2 = x_1';$$

Тогда функция Лагранжа примет вид

$$\mathcal{L} = \int_0^{\frac{\pi}{2}} \left[\lambda_0 u^2 + p_1(x_1' - x_2) + p_2(x_2' + x_1 e^{-\alpha x_1}) \right] dt + \lambda_1 x_1(0) + \lambda_2 x_2(\frac{\pi}{2}) + \lambda_3 (x_2(\frac{\pi}{2}) + \frac{\pi}{2}) dt + \lambda_1 x_2(0) + \lambda_2 x_2(\frac{\pi}{2}) + \lambda_3 (x_2(\frac{\pi}{2}) + \frac{\pi}{2}) dt + \lambda_1 x_2(0) + \lambda_2 x_2(\frac{\pi}{2}) + \lambda_3 (x_2(\frac{\pi}{2}) + \frac{\pi}{2}) dt + \lambda_1 x_2(0) + \lambda_2 x_2(\frac{\pi}{2}) + \lambda_3 (x_2(\frac{\pi}{2}) + \frac{\pi}{2}) dt + \lambda_1 x_2(0) + \lambda_2 x_2(\frac{\pi}{2}) + \lambda_3 (x_2(\frac{\pi}{2}) + \frac{\pi}{2}) dt + \lambda_1 x_2(0) + \lambda_2 x_2(\frac{\pi}{2}) + \lambda_3 (x_2(\frac{\pi}{2}) + \frac{\pi}{2}) dt + \lambda_1 x_2(0) + \lambda_2 x_2(\frac{\pi}{2}) + \lambda_3 (x_2(\frac{\pi}{2}) + \frac{\pi}{2}) dt + \lambda_1 x_2(0) + \lambda_2 x_2(\frac{\pi}{2}) + \lambda_3 (x_2(\frac{\pi}{2}) + \frac{\pi}{2}) dt + \lambda_1 x_2(0) + \lambda_2 x_2(\frac{\pi}{2}) + \lambda_3 (x_2(\frac{\pi}{2}) + \frac{\pi}{2}) dt + \lambda_1 x_2(0) + \lambda_2 x_2(\frac{\pi}{2}) + \lambda_3 (x_2(\frac{\pi}{2}) + \frac{\pi}{2}) dt + \lambda_1 x_2(\frac{\pi}{2}) + \lambda_2 x_2(\frac{\pi}{2}) + \lambda_2 x_2(\frac{\pi}{2}) + \lambda_3 (x_2(\frac{\pi}{2}) + \frac{\pi}{2}) dt + \lambda_1 x_2(\frac{\pi}{2}) + \lambda_2 x_2(\frac{\pi}{2}) + \lambda_3 (x_2(\frac{\pi}{2}) + \frac{\pi}{2}) dt + \lambda_1 x_2(\frac{\pi}{2}) + \lambda_2 x_2(\frac{\pi}{2}) + \lambda_3 (x_2(\frac{\pi}{2}) + \frac{\pi}{2}) dt + \lambda_1 x_2(\frac{\pi}{2}) dt + \lambda_2 x_2(\frac{\pi}{2}) + \lambda_3 (x_2(\frac{\pi}{2}) + \frac{\pi}{2}) dt + \lambda_1 x_2(\frac{\pi}{2}) dt + \lambda_2 x_2(\frac{\pi}{2}) dt$$

Из условий стационарности по x_1 и x_2 получим уравнения

$$p_1' = -p_2(-e^{-\alpha x_1} + \alpha x_1 e^{-\alpha x_1})$$
$$p_2' = -p_1$$

Из условий трансверсальности по x_1 и x_2 получим условия

$$p_1(0) = \lambda_1; p_2(0) = 0; \ p_1\left(\frac{\pi}{2}\right) = \lambda_2; \ p_2\left(\frac{\pi}{2}\right) = \lambda_3;$$

Из условия оптимальности по u получим $u=\frac{p_2}{2\lambda_0}$, если $\lambda_0\neq 0$. Если же $\lambda_0=0$, то из условий выше получаем, что либо минимум по u не достигается, либо все $\lambda_i=0$; $p_i=0$. Тогда положим $\lambda_0=1$, и тогда $u=\frac{p_2}{2}$.

Получили систему из четырех уравнений с начальными условиями

$$\begin{cases} x'_1 = x_2 \\ x'_2 = p_2/2 - x_1 e^{-\alpha x_1} \\ p'_1 = -p_2(-e^{-\alpha x_1} + \alpha x_1 e^{-\alpha x_1}) \\ p'_2 = -p_1 \\ x_1(0) = 0; \ p_2(0) = 0; \end{cases}$$

и двумя условиями в правом конце

$$x_1\left(\frac{\pi}{2}\right) = 0; \ x_2\left(\frac{\pi}{2}\right) = -\frac{\pi}{2};$$

С помощью метода Ньютона будем искать решение $x_1(0)$ и $p_2(0)$ системы

$$\begin{cases} x_1\left(\frac{\pi}{2}\right) = 0\\ x_2\left(\frac{\pi}{2}\right) + \frac{\pi}{2} = 0 \end{cases}$$

То есть будем искать недостающие левые условия так, чтобы попасть в правые.

В этом случае система примет вид

$$\begin{cases} x_1' = x_2 \\ x_2' = p_2/2 - x_1 e^{-\alpha x_1} \\ p_1' = -p_2(-e^{-\alpha x_1} + \alpha x_1 e^{-\alpha x_1}) \\ p_2' = -p_1 \\ x_1(0) = 0; \ p_2(0) = 0; x_1(\frac{\pi}{2}) = 0; \ x_2(\frac{\pi}{2}) = -\frac{\pi}{2}; \end{cases}$$

Вторые два уравнения дают нам:

$$p_1 = c_1 \sin t + c_4 \cos t, \ p_2 = c_1 \cos t - c_4 \sin t$$

Первые два уравнения дают нам, с учетом двух последних уравнений:

$$x_1(t) = \frac{1}{4}c_1t\sin t + c_3\sin t + c_2\cos t + \frac{1}{4}c_4(t\cos t - sint)$$

$$x_2(t) = -c_2\sin t - \frac{1}{4}c_4t\sin t + c_3\cos t + \frac{1}{4}c_1(\sin t + t\cos t)$$

Тогда, подставляя начальные условия получаем:

$$p_2(t) = -4sint; u = -2sint;$$

$$\int_0^{\frac{\pi}{2}} u^2 dt = 4 \int_0^{\frac{\pi}{2}} \sin^2 t dt = \pi$$

Проверим достаточное условие на минимум, пусть $\hat{x} + x$ - допустимая функция, тогда

$$x'(\frac{\pi}{2}) = 0, \ x\left(\frac{\pi}{2}\right) = 0, x(0) = 0$$

$$\mathcal{F}(\widehat{x} + x) - \mathcal{F}(\widehat{x}) = \int_0^{\frac{\pi}{2}} \left[(\widehat{x}'' + x'' + \widehat{x} + x)^2 - (\widehat{x}'' + \widehat{x})^2 \right] dt = \int_0^{\frac{\pi}{2}} \left[2(\widehat{x}'' + \widehat{x})(x'' + x) + (x'' + x)^2 \right] dt$$

$$= \int_0^{\frac{\pi}{2}} \left[2c \sin t(x'' + x) + (x'' + x)^2 \right] dt$$

При этом

$$\int_0^{\frac{\pi}{2}} cx'' \sin t dt = \int_0^{\frac{\pi}{2}} c \sin t dx' = cx' \sin t |_0^{\frac{\pi}{2}} - \int_0^{\frac{\pi}{2}} cx' \cos t dt$$

$$= -\int_0^{\frac{\pi}{2}} c \cos t dx = -cx \sin t |_0^{\frac{\pi}{2}} - \int_0^{\frac{\pi}{2}} cx \sin t dt = -\int_0^{\frac{\pi}{2}} cx \sin t dt$$

Следовательно

$$\mathcal{F}(\widehat{x}+x) - \mathcal{F}(\widehat{x}) = \int_0^{\frac{\pi}{2}} (x''+x)^2 dt \ge 0$$

Следовательно найденные функции доставляют глобальный минимум задачи.

4. 4. Результаты

Будем запускать метод Ньютона в точках сетки $i=\overline{-10,10},\ j=\overline{-10,10}.$

4.1 $\alpha = 0.000000$

Метод Ньютона сошелся с большого количества начальных точек к результатам, указанным

ниже.
